

Fully-Managed AppSec Services

Optimize Your Risk Posture with ThreatX Expert AppSec Service Offering
Protect your applications with 24/7 monitoring, response, and threat hunting driven by AppSec experts and collective intelligence.

Application security is a 24-hour process and the daily demands of AppSec operations can easily overwhelm even the best security teams. ThreatX Fully-Managed AppSec Services let you offload this work to our team of highly skilled application security experts. Our SOC provides 24x7 proactive cyber monitoring, streamlined threat response while partnering with your team to ensure you are informed and confident that your applications are securely protected.

The ThreatX SOC team manages the day-to-day administration of the ThreatX platform. Working alongside your security team, we'll fine-tune the solution specifically to meet the needs of your environment and the unique threats it faces. ThreatX Labs stays up-to-date on the latest trends in web application and API security and applies those learnings to ensure your applications are protected.

KEY FEATURES

- » Proactive threat hunting and monitoring
- » Global threat analysis
- » Virtual patching and vulnerability alerting
- » Consultation on application security
- » Onboarding of new sites and applications
- » 24x7 administration of web application security
- » Custom tuning for unique environments

AppSec Talent & Expertise

Organizations often struggle to find the time and talent needed to keep pace with the daily demands of security operations. ThreatX provides a dedicated team of AppSec engineers and analysts who specialize in Layer 7 threats and vulnerabilities. This includes expertise in WAF management, behavioral analysis, anti-bot, and DDoS mitigation. The ThreatX team is highly trained, experienced, and continuously focused on the latest changes in the application threat landscape. Using ThreatX's fully-managed AppSec services lets organizations offload work to our AppSec experts, freeing your staff to focus on high-priority projects.

24x7 Security and Availability

Your applications can be attacked at any time, day or night. ThreatX's fully-managed Appsec services ensure your applications are always protected with 24-hour monitoring, response, and alerting. ThreatX also recognizes availability of your application is paramount. We commit to responding to urgent situations our customers raise within 15 minutes 24x7x365 and will work it as top priority until the situation is resolved. Most importantly, we trust our customers to define what issues are "urgent".

Incident Response and Triage

The ThreatX team monitors for signs of malicious actors or high-risk entities, and takes action when they are detected. Detections are driven by a combination of entity profiling, behavioral analysis, attacker deception, and ongoing tracking of entity behaviors across the kill chain. All incidents are verified, analyzed, and prioritized for response and mitigation. This ensures all incidents are managed properly and quickly while reducing the need for organizations to perform Tier I and Tier III analysis in house.

Threat Hunting

ThreatX provides proactive monitoring of customer environments and threat hunting to surface signs of attack. Staff monitors a wide variety of signals generated by behavioral and entity profiling, heuristics, and other intelligence sources. The ThreatX global SOC continuously collects IOCs and tracks threats across the Internet to ensure the ability to detect new and evolving threats facing customer applications.

Custom Countermeasures

Applications face a wide range of threats including exploits, bots, and DDoS attacks, and attackers often target their attacks to the unique traits of the application. ThreatX provides the option to create customized countermeasures and mitigation policies uniquely tailored to the customer environment. These policies can be generated on-demand in response to newly detected threats or can be generated based on SOC recommendations and business requirements unique to the application or environment.

Vulnerability Monitoring and Virtual Patching

The ThreatX team continuously monitors for new and existing vulnerabilities that can affect customer applications. When new relevant CVEs are published, ThreatX notifies customers and provides short and long-term patching recommendations including patching of applications and web services. We also provide virtual patching of zero-day vulnerabilities to ensure assets stay protected until a permanent patch can be delivered.

Ongoing Maintenance and Tuning

ThreatX tracks and manages potential problems such as when certificates are near expiration and providing certificate updating support when required. Expert staff also provides ongoing tuning and optimization of the WAF to ensure efficient SOC operations.

LEARN MORE

With ThreatX, you get the most advanced and complete application security platform on the market. ThreatX's Fully-Managed AppSec Services give you access to an always-on team of application security experts to help defend your environment. To learn more, visit threatx.com.
